

AMENDMENT

Amendments to the Claims

1. (Currently Amended) An open-network system for automating an architectural process of creating a plurality of aspects of a contract document comprising:
 - a graphic user interface for user-selected project-specific features;
 - at least one attribute information storage means, comprising a database from which a user-selected attribute is identified, each attribute having a unique identifier and data associated with it;
 - a filter for providing a graphical user interface with filtered data associated with a user-selected attribute;
 - a user database which stores the unique identifier of the user-selected attribute;
 - automated selection means for incorporating data associated with the user-selected attribute into the plurality of aspects of said contract document; and
 - a document generation means for creating the plurality of aspects of the contract document;wherein the plurality of aspects of the contract document comprises
 - a) an item enumeration comprising a listing of repetitive building parts a-schedule; and
 - b) a technical attribute listing comprising a written detailed description of materials and processes that make up a building a-specification.
2. (Currently Amended) An open-network system for automating an architectural process of creating a plurality of aspects of a contract document comprising:
 - data entry means for user-selected project-specific attributes;
 - at least one attribute information storage means, comprising a database from which the user-selected attribute is identified, each attribute having a unique identifier and data associated with it;

at least one remote attribute information storage means, comprising a database from which the user-selected attribute is identified, each attribute having a unique identifier and data associated with it;

a filter for providing a graphical user interface with filtered data associated with a user-selected attribute;

a user database which stores the unique identifier of the user-selected attribute;

automated selection means for incorporating data associated with the user-selected attribute into said plurality of aspects of said contract document; and

generation means for creating said plurality of aspects of the contract document;

wherein the plurality of aspects of the contract document comprises

- a) an item enumeration comprising a listing of repetitive building parts a schedule; and
- b) a technical attribute listing comprising a written detailed description of materials and processes that make up a building a specification.

3. (Previously presented) The open-network system of claim 2, further comprising means for tracking a project.

4. (Currently Amended) An open-network system for automating an architectural process of creating a plurality of aspects of a contract document comprising:

data entry means for user-selected project attributes;

at least one attribute information storage means, comprising a database from which the user-selected attribute is identified, each attribute having a unique identifier and data associated with it;

at least one remote attribute information storage means, comprising a database from which the user-selected attribute is identified, each attribute having a unique identifier and data associated with it;

a filter for providing a graphical user interface with filtered data associated with a user-selected attribute;

a user database which stores the unique identifier of the user-selected attribute;

automated selection means for incorporating data associated with the user-selected attribute into at least one digital file, the digital file comprising data associated with an aspect of said contract document;

generation means for creating the digital file; and

searching means for querying the user database;

wherein the plurality of aspects of the contract document comprises

- a) an item enumeration comprising a listing of repetitive building parts a schedule; and
- b) a technical attribute listing comprising a written detailed description of materials and processes that make up a building a specification.

5. (Previously presented) The open-network system of Claim 4, wherein the digital file created by the generation means comprises industry accepted tags.

6. (Currently Amended) An open-network system for automating an architectural process of creating a plurality of aspects of a contract document comprising:

data entry means for user-selected project attributes, the data entry means comprising a graphical user interface having text entry and drop-down menu choices;

at least one attribute information storage means, comprising a database from which the user-selected attribute is identified, each attribute having a unique identifier and data associated with it;

a filter for providing the drop-down menu choices of the graphical user interface with filtered data associated with a user-selected attribute;

a user database which stores the unique identifier of the selected attribute;

automated selection means for incorporating data associated with the selected attribute into said plurality of aspects of said contract document wherein said plurality of aspects comprises an item enumeration comprising a listing of repetitive building parts architectural specification, architectural details, and a technical attribute listing comprising a written detailed description of materials and processes that make up a building architectural schedule or architectural project status; and

generation means for creating the plurality of aspects of the contract document.

7. (Currently Amended) A method for automating an architectural process of preparing one or more a plurality of aspects of a contract document comprising architectural drawings, an item enumeration aspect ~~a schedule aspect~~ listing attributes of repetitive building parts to be incorporated into a building, and a technical attribute listing ~~describing a specification aspect~~ listing materials and processes selected to construct the building, the method comprising: maintaining an association between each of a plurality of pieces of selectable design information for a building and a plurality of respective data entry location locations in both one or more of the schedule item enumeration aspect and the specification aspect technical attribute listing;
- allowing a user to select an attribute for a building;
- in response to a user selection of an attribute of a building, retrieving information associated with the selected attribute and graphically displaying a data entry form populated by the filtered associated information by referencing a unique identifier for each attribute and information associated with said respective unique identifier;
- storing user selections of each attribute in a user database; and
- generating one or more said plurality of said aspects of said contract document in one or more of a plurality of formats by accessing the association of the ~~one or more aspects~~ plurality of respective data entry locations with stored user selected attributes in the user database.
8. (Currently Amended) The method of claim 7, wherein the data associated with a user selected attribute is associated via the unique identifier with ~~a vector equation~~ a representation equation representing the geometry of the parameterized parts of a drawing, the generating of the document comprising generating a detail aspect based on at least said vector representation equation associated with said selected attribute.
9. (Currently Amended) The method of claim 8, further comprising integrating the ~~vector representation~~ representation equations into a selected one of a group consisting of a plan view and an elevation view.
10. (Currently Amended) The method of claim 7, further comprising:

- a) presenting a human interface for a diagram utility allowing a user to selectively preview and create one or more of said architectural drawings; and
- b) automatically creating said one or more architectural drawings using data from said respective data entry locations in said item enumeration aspect and said technical attribute listing.

11. (Currently Amended) The method of claim 7, further comprising:
in response to a user selected attribute accessing a manufacturer catalog page through a browser;
allowing the user to select a catalog item from said manufacturer catalog page; and
generating the item enumeration aspect ~~a schedule aspect~~ of the architectural contract containing data associated with the selected catalog item.
12. (Currently Amended) The method of claim 7 further comprising:
allowing said user to create or edit ~~one or more~~ said plurality of the aspects of said contract document using one or more formats from said plurality of formats.
13. (Previously presented) The method of claim 7 wherein said plurality for formats are selected from a group of formats consisting of:
- (a) a spreadsheet;
 - (b) an Extensible Markup Language (XML);
 - (c) a Computer aided design (CAD); and
 - (d) word processing.
14. (Currently Amended) The method of claim 7 wherein allowing said user to edit said ~~specification aspect~~ technical attribute listing of said contract document further comprises:
using a text editor
- a) maintaining a plurality of linkages between aspects of information in said technical attribute listing;

- b) using said plurality of linkages, automatically renumbering sections of said technical attribute listing, wherein said sections comprise paragraphs and subparagraphs, based on changes made to said technical attribute listing;
- c) allowing said user to use a text editor to edit a final draft of said technical attribute listing, wherein said final draft is created automatically based on said user selections of said each attribute stored in said user database.

15. (Currently Amended) The method of claim 7 wherein at least one piece of design information from said pieces of selectable design information is stored in a selected one of a group consisting of:

- (a) ~~a-schedule~~ an item enumeration database;
- (b) a catalog database;
- (c) a drawing database; and
- (d) ~~a-specification~~ technical attribute listing database.

16. (New) The system of claim 1 wherein the item enumeration consists of a schedule, and wherein the technical attribute listing consists of a specification.

17. (New) The method of claim 7 wherein said item enumeration aspect consists of a schedule, and wherein said technical attribute listing consists of a specification.

18. (New) A computer readable medium having stored thereon a set of computer executable instructions operable to configure a computer to perform the method of claim 17 wherein the schedule indicates to a contractor a type a finish to use for a door, and wherein the specification indicates how the finish should be applied.
